notes for the ocular machine

THE RUIN

that the light is never identical to its source
means that it is always inhabited by a certain distance or darkness.

[C/M.J.]

everything that can become an object of internal perception is virtual,
like the image in the telescope produced by the crossing of light rays.

[S.F.]

STRUCTURE

for a more extended power of looking, a mental arrangement is
necessary inside the skull, resembling the material arrangement
of a telescope.

[U]

MEMORY

the signal shrinks as the memory grows.

[H.B.]

the external memory of events

is contained in the incoming signal, as it approaches the eye.

the internal memory of events

is contained in the outgoing signal, as it approaches the eye.

DISTORTION

the passage through any medium will distort the signal to a certain
degree, that which seems to be alike may have been
different at another distance or in another dimension.

the cells of the retina correspond to stars in space;

and the human eye, with its internal imperfections and fluids, corresponds to
Earth's atmosphere since both are constantly changing.

[Adaptive optics research]

the further back in time one looks, in order to perceive the distant light,
it is advisable to glance sideways (out of focus)
